

NEW MRT Module adds functionality to P3 MRSS

Millennium Sensor, LLC introduces a new wireless receiver module that adds capability to its Extreme Rapid Deployment Sensor System, MRSS. MRSS operates under Millennium Sensor's P3 Technology Concept (Personnel - Centric Peripheral Protection).

The Mobile Remote Trigger (MRT) is a wireless receiver module that is the same size, shape and weight as a standard MRSS sensor module. Each MRT module is encoded with a unique ID from 1 through 16 and will respond to any standard MRSS sensor with the same ID code.

The MRT must be within 100 ft. of its intended sensor. The MRT

will trigger its internal reed relay (very quiet - no click) when the sensor activates. This contact closure is brought out of the MRT through a simple plug connector allowing different types of external devices to be operated.

Example devices might be a loud speaker or alarm, an IR Illuminator, a camera trained on the sensor space, an audio recorder or any number of other events that can be initiated by a simple contact closure.

At the time of a sensor activation the MRT Module will remain active for 60 seconds or until another sensor activation occurs.

Contact Millennium Sensor, LLC or email us at info@msensor.com for more information.
